

Ports #flushyourmeds Scott Barry ;

If you are Subjected to Freemasonic Gang Stalking and one of the things you experience is Remote Access of your Computer, for instance I have a Stupid Arch Linux Machine, and one Solution I found is Linux Unified Key Setup combined with Closing Port 631 IPP Cups.

Real easy to do, run task manager, search cups into Arco or Manjaro or Kubuntu Linux, or whatever Linux you use, it will either be CUPSD or CUPS, this process is a Linux Backdoor, to close it type su root or sudo killall cups, then delete it using Catfish or Thunar or whatever file manager you use as root, google the file location in an Internet Search, delete the file using rm as root after killing it, now reboot your PC do a port scan with nmap -Pn -O localhost and your ISP, see the ports open, now they are closed, it will say all one thousand ports are in ignored states meaning they are closed, now you no longer need that password lock to protect your open ports, but you can set a port lock with passwd user root so they need a password to get in. Always set a root, user, and LUKS, BIOS password, always spoof the mac address to RANDOM and use 8888 DNS then download the Ultimate Hosts File Blacklist on Github, then of course for Chromium and Firefox get Ublock Origin, Privacy Badger, Decentraleyes, Canvas Blocker, Return YT Dislikes, Downthemall, and the essentials for Browsing, Make sure those run in private tab, and for your third Sandbox Falkon in Private Tab, it works One Hundred ... ; Never give emails to Websites that data breach, never give debits away, Prepaid Visas only, Privacy dot com, use Email On Deck, Temporary Outlook, Mailfence, tuta, accounts to bypass the limits of email, email has a fifteen onth Policy meaning you get deleted when you dont use email so use only only two main maybe Proton and other emails BC, they want you to submit to the Subnetting Technocracy Period.
